

AWS Arsenic Monitor

Ultimate Dual Tank Protection System
with Water Sample Taps and Meter Control

The AWS Arsenic Monitor

point-of-entry system is an Arsenic elimination system that provides you and your family with the assurance and peace of mind you need.

When you combine dual tanks, routine testing, monitoring and service, you have **ultimate protection**. Once the primary Arsenic reduction tank has reached its removal capacity, you will have Arsenic **here** but not **here**.

The ultimate protection provided by the protector tank will ensure that you don't have elevated levels of Arsenic here, where it matters the most.

AWS Arsenic Monitor

Ultimate Dual Tank Protection System

with Water Sample Taps and Meter Control

Meter Control monitors water use and has integrated sample ports to allow for water sampling before, between and after the two Arsenic removal treatment tanks.

The Arsenic Monitor consists of 2 treatment tanks in series. Having two Arsenic removal tanks in a lead/lag, series formation provides Arsenic removal redundancy and optimizes the removal capacity of the media. This assures that the Arsenic tanks stay in service as long as possible while still providing Ultimate Protection.
